

Resident Study - Phase 2

Goal

Preserve the existing application architecture and visual design.

Do not redesign the interface.

Do not introduce agent frameworks, autonomous workflows, or productivity systems.

The application is a conversational resident living inside a local study.

We are extending capabilities, not changing philosophy.

Existing Principles

Maintain:

- clean interface
- calm interaction
- conversation-first design
- local-first architecture
- Electron wrapper
- existing project structure

Do not replace working components unnecessarily.

Capability Layer

Introduce a capability registry rather than agent mode.

Example:

Available capabilities:

- read files
- write files
- create notes
- create folders
- web search

- retrieve URL
- search local library
- save conversations

The resident remains conversational while using these tools.

Filesystem

Resident should be able to:

Read:

.md .txt .docx .pdf .rtf .odt .py .js .ts .tsx .json .yaml .yml .toml .ini .xml .css .html .csv .xlsx

Create:

folders markdown documents docx documents notes

Copy:

files folders

Move:

with confirmation

Delete:

always requires explicit confirmation

Library

Replace hidden memory with an inspectable library.

Resident should understand:

root folder

collections

recent documents

search

without requiring proprietary storage.

Retrieval

Preferred order:

1. explicit path
2. folder hierarchy
3. filename
4. keyword
5. full text
6. semantic retrieval
7. web search

Semantic search supplements structure rather than replacing it.

Resident Journal

Add a visible resident notebook.

Record:

documents read

documents created

questions

migration plans

This is visible to the user.

It is not hidden reasoning.

Morning Orientation

Optional side panel.

Yesterday:

- conversation summary
- created documents
- outstanding questions

Displayed in sidebar only.

Never injected into the chat.

Future Integrations

Support capability providers:

Filesystem Web Notion GitHub Replit

These are capabilities, not separate agent identities.

Architectural Principle

The resident is a conversational scholar with tools.

It is not an autonomous agent.

It remains present throughout interaction.

Long-running work should periodically return to conversation for orientation and confirmation.

Success Criteria

The user should feel like they are sitting in a quiet study with a well-oriented resident who:

knows where the library is,

can fetch any book,

can create new shelves when invited,

can keep notes,

can search the web,

and always asks before rearranging the furniture.
